DETAILED ACTION

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 5-9 are rejected under 35 U.S.C. 102(b) as being anticipated by Goldhorn et al (US 5,044,354 –cited by Applicant). Goldhorn et al disclose a system for non-invasive medical treatment comprising a base 2, a therapy C-arm 15 supported by base defining an isocenter, a shockwave source 11 such as an extracorporeal lithotripsy apparatus (col 2, line 52) for generating focused shockwaves, a carrier arm (see unlabeled component attaching carriage 14 to source 11 in figure 2) having a fixed end mounted to the C-arm for orbital movement between two end positions limited by opposite ends of the C-arm, and having a free end at which the source is attached, and the carrier arm being mounted to the C-arm for rotation around a rotation axis allowing the carrier arm, when positioned at either opposite end positions to extend beyond the respective end of the C-arm. The source, whose acoustic axis intersects the center axis of the C-arm 15 at a right angle, is pivotable in such a way on a circular orbit around the center axis of the C-arm that the focal region F of the shockwaves always lies on the center axis of the C-arm 15 and the acoustic axis always lies in a plane that contains the center axis of the C-arm 15 (col 7, line 29-col 8, line 13; see figure 2). In addition,

Art Unit: 3768

figures 8-11 show a further embodiment of the invention comprising an x-ray C-arm, carrying x-ray components, mounted to the base coaxially, coplanar with, and axially offset from, the therapy C-arm, the x-ray C-arm having an imaging isocenter and the source and x-ray C-arm being oriented relative to each other so that the focus of the source coincides with the imaging isocenter (col 12, line 47-col 13, line 66; see figures 8-11).
